
The Two Day Course- Visual Perceptual and Cognitive Development

Carl G. Hillier OD, FCOVD - Granada, Spain -March 2019

Course Review

Attention, memory, perception, and cognition constitute who we have been, who we are and what we will be in the future. This course investigates the various aspects of attention and memory: the foundation for perceptual and cognitive development. It is a practical course that covers testing, diagnosis, etiology and treatment.

Developmental Optometry's clinical training in binocular vision, ocular motility, attention and memory skills make the perceptual learning protocols we provide uniquely valuable. Weaving attention, memory, perceptual, and cognitive treatment plans into existing functional treatment protocols will provide the most complete opportunity for visual development.
