How Vision Resides In The Brain: How Neuro-adaptive Learning and Visual Perceptual Learning Can Re-establish Cognitive and Functional Abilities.

Speaker: Carl Hillier, OD, FCOVD
San Diego Center For Vision Care

Fifty percent of those who have sustained a brain injury have had their visual perceptual connection with the world disrupted. The first contact with our visual world is the way our eyes move, focus and work together as a team. Then, spatial processing and visually guided movement become essential for recapturing who you were before your injury.

Finally, re-establishing your thinking skills and memory skills can bring you back. Visual Perceptual Learning and Neuro-adaptive Learning is what Rehabilitative Optometrists do to help you heal.
